  JOURNAL   Submitted (05-JAN-1999) Joint Genome Institute, Lawrence Livermore
            National Laboratory, 7000 East Ave., Livermore, CA 94551, USA
COMMENT     Map and sequence oriented from p telomere to centromere. Cosmid
            F25540 overlaps cosmid R33777 to the left from bases 1 to 552 of
            this accession, and overlaps cosmid R26610 to the right from bases
            39,967 to 42,642. Additional map and sequence information are
            available at: http://www-bio.llnl.gov/bbrp/genome/genome.html.

SCCEN12RG/c
LOCUS       SCCEN12RG              43676 bp    DNA     linear   PLN 18-APR-2005
DEFINITION  S.cerevisiae DNA from CEN12 region including ATS/APSG, SCD25, SOF1,
            DRS1, MMM1 and DNM1 genes.
ACCESSION   X91488
VERSION     X91488.1  GI:1495203
KEYWORDS    ATS/APSG gene; DNM1 gene; DRS1 gene; MMM1 gene; SCD25 gene; sof1
            gene.
SOURCE      Saccharomyces cerevisiae (baker's yeast)
  ORGANISM  Saccharomyces cerevisiae
            Eukaryota; Fungi; Ascomycota; Saccharomycotina; Saccharomycetes;
            Saccharomycetales; Saccharomycetaceae; Saccharomyces.
REFERENCE   1  (bases 1 to 43676)
  AUTHORS   Damak,F., Boy-Marcotte,E., Le-Roscouet,D., Guilbaud,R. and
            Jacquet,M.
  TITLE     SDC25, a CDC25-like gene which contains a RAS-activating domain and
            is a dispensable gene of Saccharomyces cerevisiae
  JOURNAL   Mol. Cell. Biol. 11 (1), 202-212 (1991)
   PUBMED   1986220
REFERENCE   2  (bases 1 to 43676)
  AUTHORS   Ripmaster,T.L., Vaughn,G.P. and Woolford,J.L. Jr.
  TITLE     A putative ATP-dependent RNA helicase involved in Saccharomyces
            cerevisiae ribosome assembly
  JOURNAL   Proc. Natl. Acad. Sci. U.S.A. 89 (23), 11131-11135 (1992)
   PUBMED   1454790
REFERENCE   3  (bases 1 to 43676)
  AUTHORS   Burgess,S.M., Delannoy,M. and Jensen,R.E.
  TITLE     MMM1 encodes a mitochondrial outer membrane protein essential for
            establishing and maintaining the structure of yeast mitochondria
  JOURNAL   J. Cell Biol. 126 (6), 1375-1391 (1994)
   PUBMED   8089172
REFERENCE   4  (bases 1 to 43676)
  AUTHORS   Gammie,A.E., Kurihara,L.J., Vallee,R.B. and Rose,M.D.
  TITLE     DNM1, a dynamin-related gene, participates in endosomal trafficking
            in yeast
  JOURNAL   J. Cell Biol. 130 (3), 553-566 (1995)
   PUBMED   7622557

                Center code: BCM
                Web site: http://www.hgsc.bcm.tmc.edu/
                Contact: hgsc-help@bcm.tmc.edu
            ---------- Project Information
                Center project name: OBAD
                Center clone name: DPSF1-548A4
            ---------- Summary Statistics
                Sequencing vector: Plasmid;
                Sequencing vector: M13;
                Chemistry: Dye-terminator Big Dye: 100% of reads
                Assembly program: Phrap; version 0.990329
                Consensus quality: 48837 bases at least Q40
                Consensus quality: 49308 bases at least Q30
                Consensus quality: 49614 bases at least Q20
            ----------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 1 contigs. Gaps between the contigs
            * are represented as runs of N. The order of the pieces
            * is believed to be correct as given, however the sizes
            * of the gaps between them are based on estimates that have
            * provided by the submittor.
            * This sequence will be replaced
            * by the finished sequence as soon as it is available and
            * the accession number will be preserved.

                Center clone name: 1427_K_10
            --------------.
            * NOTE: This record contains 62 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      695: contig of 695 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (17-FEB-2001) Whitehead Institute/MIT Center for Genome
            Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT     On Dec 21, 2001 this sequence version replaced gi:14141771.
            All repeats were identified using RepeatMasker:
            Smit, A.F.A. & Green, P. (1996-1997)
            http://ftp.genome.washington.edu/RM/RepeatMasker.html
            -------------- Genome Center
                Center: Whitehead Institute/ MIT Center for Genome Research

            -------------- Project Information
                Center project name: L11855
                Center clone name: 684_M_15
            --------------.
            * NOTE: This record contains 60 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      709: contig of 709 bp in length
            *      710      809: gap of 100 bp

gc-help@bcm.tmc.edu

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

ANNOTATION OF FEATURES:
STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.
Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.
Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL:
http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html.

COMMENT     On Dec 26, 2002 this sequence version replaced gi:23573346.
            Sequence from the Mouse Genome Sequencing Consortium whole genome
            shotgun may have been used to confirm this sequence.  Sequence data
            from the whole genome shotgun alone has only been used where it has
            a phred quality of at least 30.
            -------------- Genome Center

            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.

                Center project name: H_NH1365D11
            --------------.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
```

all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc

SOURCE INFORMATION:
The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E., Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
VECTOR: pBACe3.6

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the right is RP11-478C6, 2000 bp overlap. Actual start of this clone is at base position 1 of RP11-1365D11; actual end is at base position 141594 of RP11-478C6.

Single plasmid region exists between 24434 and 24458. Polymorphisms exist between AC079140 and AC108475.

                Contact: sequence_submissions@genome.wi.mit.edu
            -------------- Project Information
                Center project name: L11499
                Center clone name: 815_P_21
            -------------- Summary Statistics
                Sequencing vector: Plasmid; n/a; 100% of reads
                Chemistry: Dye-terminator Big Dye; 100% of reads
                Assembly program: Phrap; version 0.960731
                Consensus quality: 55130 bases at least Q40
                Consensus quality: 55883 bases at least Q30
                Consensus quality: 56050 bases at least Q20
                Insert size: 61000; agarose-fp
                Insert size: 56110; sum-of-contigs
                Quality coverage: 7.9 in Q20 bases; agarose-fp
                Quality coverage: 8.6 in Q20 bases; sum-of-contigs
            --------------.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 3 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1    46566: contig of 46566 bp in length
            *    46567    46666: gap of 100 bp
            *    46667    50756: contig of 4090 bp in length
            *    50757    50856: gap of 100 bp
            *    50857    56310: contig of 5454 bp in length.

            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
            was generated from part of bacterial clone contigs of human
            chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping
            Group.  Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr6
            DADB-225M10 is from a DNA-arts DBB human bac library VECTOR:
            pBeloBAC11.

            --------------.
            * NOTE: This record contains 78 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.

                Web site: http://www-seq.wi.mit.edu
                Contact: sequence_submissions@genome.wi.mit.edu
            -------------- Project Information
                Center project name: L14228
                Center clone name: 54_C_6
            --------------.
            * NOTE: This record contains 78 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      657: contig of 657 bp in length

            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 5 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.

            -------------- Project Information
                Center project name: L1279
                Center clone name: 173_P_23
            --------------.
            * NOTE: This record contains 76 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      703: contig of 703 bp in length
            *      704      803: gap of 100 bp
            *      804     1497: contig of 694 bp in length
            *     1498     1597: gap of 100 bp
            *     1598     2306: contig of 709 bp in length
            *     2307     2406: gap of 100 bp
            *     2407     3090: contig of 684 bp in length
            *     3091     3190: gap of 100 bp
            *     3191     3867: contig of 677 bp in length

            -------------- Project Information
                Center project name: L6384
                Center clone name: 817_M_3
            --------------.
            * NOTE: This record contains 77 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      734: contig of 734 bp in length
            *      735      834: gap of 100 bp

            -------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
```

```
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest. The following
            abbreviations are used to associate primary accession numbers given
            in the feature table with their source databases: Em:, EMBL; Sw:,
            SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP
            database can be found at

            Clone requests: clonerequest@sanger.ac.uk
COMMENT     On May 20, 2001 this sequence version replaced gi:13375013.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
            was generated from part of bacterial clone contigs of human
            chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping
            Group.  Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr9
            RP11-217F16 is from the library RPCI-11.1 constructed by the group
            of Pieter de Jong. For further details see
            http://www.chori.org/bacpac/home.htm

            --------------
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one subclone; and the assembly was confirmed by restriction digest,
            except on the rare occasion of the clone being a YAC.

            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
            was generated from part of bacterial clone contigs constructed by
            the MHC Haplotype Consortium and collaborators. Further information
            can be found at
            http://www.sanger.ac.uk/HGP/Chr6/MHC
            DAMA-186H17 is from the DNA-Arts human BAC library MANN.1 VECTOR:

                Web site: http://www-seq.wi.mit.edu
                Contact: sequence_submissions@genome.wi.mit.edu
            -------------- Project Information
                Center project name: L13128
                Center clone name: 327_C_2
            --------------.
            * NOTE: This record contains 82 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      696: contig of 696 bp in length

            -------------- Project Information
                Center project name: L21360
                Center clone name: 195_K_9
            --------------.
            * NOTE: This record contains 81 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      674: contig of 674 bp in length
            *      675      774: gap of 100 bp
            *      775     1480: contig of 706 bp in length
            *     1481     1580: gap of 100 bp

            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: zfish-help@sanger.ac.uk
            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep Clone-derived
            Zebrafish pUC subclones occasionally display inconsistency over the
            length of mononucleotide A/T runs and conserved TA repeats. Where
            this is found the longest good quality representation will be
            submitted.
            Repeat names beginning 'Dr' were identified by the Recon repeat
            discovery system (Zhirong Bao and Sean Eddy, submitted), and those
            beginning 'drr' were identified by Rick Waterman (Stephen Johnson
            lab, WashU).  For further information see
            http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml CH211-112A3
            is from a CHORI-211 BAC library

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 15 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     7406: contig of 7406 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (06-AUG-1999) Drosophila Genome Center, Lawrence Berkeley
            Laboratory, MS 64-121, Berkeley, CA 94720, USA
COMMENT     On Sep 16, 1999 this sequence version replaced gi:5734692.
            For further information about this sequence, including its location
            and relationship to other sequences, please visit our sequence
            archive Web site (http://www.fruitfly.org/sequence/) or send email
            to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet
            the following cutoffs: length >= 200 bases.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 79 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1      571: contig of 571 bp in length
            *      572      651: gap of unknown length
            *      652     1378: contig of 727 bp in length
            *     1379     1458: gap of unknown length
            *     1459     2030: contig of 572 bp in length
            *     2031     2110: gap of unknown length
            *     2111     2716: contig of 606 bp in length
            *     2717     2796: gap of unknown length
            *     2797     3187: contig of 391 bp in length
            *     3188     3267: gap of unknown length
            *     3268     3883: contig of 616 bp in length
            *     3884     3963: gap of unknown length
            *     3964     4557: contig of 594 bp in length
            *     4558     4637: gap of unknown length
            *     4638     5327: contig of 690 bp in length
            *     5328     5407: gap of unknown length
            *     5408     5914: contig of 507 bp in length
            *     5915     5994: gap of unknown length
            *     5995     6552: contig of 558 bp in length
            *     6553     6632: gap of unknown length
            *     6633     7295: contig of 663 bp in length
            *     7296     7375: gap of unknown length
            *     7376     7993: contig of 618 bp in length
            *     7994     8073: gap of unknown length
            *     8074     8991: contig of 918 bp in length
            *     8992     9071: gap of unknown length
            *     9072     9658: contig of 587 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (09-MAY-2001) Department of Genetics, Washington
            University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA
COMMENT     On Mar 23, 2001 this sequence version replaced gi:10312294.
            -------------- Genome Center
                Center: Washington University Genome Sequencing Center
                Center code: WUGSC
                Web site: http://genome.wustl.edu/gsc
                Contact: sapiens@watson.wustl.edu
            -------------- Summary Statistics
                Center project name: H_NH0468D10
            --------------.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            The position of this clone was established as part of a
            collaboration between the Human Chromosome Y Mapping Project
            (Tomoko Kawaguchi, Helen Skaletsky, Laura G. Brown, Steve Rozen,
            and David C. Page at the Whitehead Institute for Biomedical
            Research, Cambridge MA) and the Washington University Genome
            Sequencing Center, St. Louis MO.

            SOURCE INFORMATION:
            The RPCI-11 human BAC library was made from the blood of one male
            donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E.,
            Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved
            approach for construction of bacterial artificial chromosome
            libraries.  Genomics 51:1-8.  The clone may be obtained either from
            Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
            and coworkers at the Roswell Park Cancer Institute
            (http://bacpac.med.buffalo.edu)
            VECTOR:  pBACe3.6
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is RP11-157F24, 200 bp overlap; the
            clone sequenced to the right is RP11-945E12, 200 bp overlap.
            Actual start of this clone is at base position 41625 of
            RP11-157F24; actual end is at base position 66680 of RP11-468D10.

COMMENT     On Jul 13, 2001 this sequence version replaced gi:14578148.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest.

COMMENT     On Apr 10, 2003 this sequence version replaced gi:29691849.
            Sequence from the Mouse Genome Sequencing Consortium whole genome
            shotgun may have been used to confirm this sequence.  Sequence data
            from the whole genome shotgun alone has only been used where it has
            a phred quality of at least 30.
            -------------- Genome Center
            Center: Wellcome Trust Sanger Institute
            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: humquery@sanger.ac.uk
            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at

COMMENT     Address for correspondence: kaos@kazusa.or.jp
            For the latest information on annotation of this clone, please see
            http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=K9P8
            Genes with similarity to proteins in the databases are described in
            'product' or 'note' qualifiers.  Genes that have no significant
            protein similarity are described as 'unknown protein'.
            The software programs used to predict genes include: Grail
            (Informatics Group, Oak Ridge National Laboratory,
            http://compbio.ornl.gov/Grail-1.3/),
            GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
            NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
            Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
            SplicePredictor (Volker Brendel, Stanford University,
            http://gremlin1.zool.iastate.edu/cgi-bin/sp.cgi).
            Genes encoding tRNAs are predicted by tRNAscan-SE
            (Sean Eddy, Washington University School of Medicine, St. Louis,
            http://genome.wustl.edu/eddy/tRNAscan-SE/).
            This sequence may not be the entire insert of this clone. It may be
            shorter because we remove overlaps between neighboring submissions.
            The 5' clone is K21G20 and the 3' clone is MPF21.

  TITLE     Structural analysis of Arabidopsis thaliana chromosome 3. II.
            Sequence features of the 4,251,695 bp regions covered by 90 P1, TAC
            and BAC clones
  JOURNAL   DNA Res. 7 (3), 217-221 (2000)
   PUBMED   10907853
REFERENCE   2  (bases 1 to 71327)
  AUTHORS   Kaneko,T., Kato,T., Sato,S., Nakamura,Y., Asamizu,E. and Tabata,S.
  TITLE     Direct Submission
  JOURNAL   Submitted (01-MAR-2000) Yasukazu Nakamura, Kazusa DNA Research
            Institute, Department of Plant Gene Research; 1532-3, Yana,
            Kisarazu, Chiba 292-0812, Japan (E-mail:ynakamu@kazusa.or.jp,
            Tel:81-438-52-3935, Fax:81-438-52-3934)
COMMENT     Address for correspondence: kaos@kazusa.or.jp
            For the latest information on annotation of this clone, please see
            http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=F5N5
            Genes with similarity to proteins in the databases are described in
            'product' or 'note' qualifiers.  Genes that have no significant
            protein similarity are described as 'unknown protein'.
            The software programs used to predict genes include: Grail
            (Informatics Group, Oak Ridge National Laboratory,
            http://compbio.ornl.gov/Grail-1.3/),
            GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
            NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
            Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
            SplicePredictor (Volker Brendel, Stanford University,
            http://gremlin1.zool.iastate.edu/cgi-bin/sp.cgi).
            Genes encoding tRNAs are predicted by tRNAscan-SE
            (Sean Eddy, Washington University School of Medicine, St. Louis,
            http://genome.wustl.edu/eddy/tRNAscan-SE/).
            This sequence may not be the entire insert of this clone. It may be
            shorter because we remove overlaps between neighboring submissions.
            The 5' clone is MWI23 and the 3' clone is MXC7.

            --------------
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one subclone; and the assembly was confirmed by restriction digest,
            except on the rare occasion of the clone being a YAC.

--------------.
* NOTE: This record contains 86 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

            --------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-11 human BAC library was made from the blood of one male
            donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E.,
            Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved
            approach for construction of bacterial artificial chromosome
            libraries. Genomics 51:1-8. The clone may be obtained either from
            Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
            and coworkers at http://www.chori.org
            VECTOR:  pBACe3.6

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is RP11-505O20, 2000 bp overlap.
            Actual start of this clone is at base position 105068 of
            RP11-505O20; actual end is at base position 73565 of RP11-48K7.

             -------------- Project Information
                 Center project name: H238
                 Center clone name: RP3-491L6
             -------------- Summary Statistics
                 Sequencing vector: M13; 100% of reads
                 Chemistry: Dye-terminator Big Dye; 100% of reads
                 Assembly program: Phrap; version 0.990329
                 Consensus quality: 69941 bases at least Q40
                 Consensus quality: 71673 bases at least Q30
                 Consensus quality: 73001 bases at least Q20
                 Quality coverage: 5,68 in Q20 bases; sum-of-contigs
             --------------.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 4 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     3432: contig of 3432 bp in length
            *     3433     3532: gap of unknown length
            *     3533     7836: contig of 4304 bp in length
            *     7837     7936: gap of unknown length
            *     7937    47443: contig of 39507 bp in length
            *    47444    47543: gap of unknown length
            *    47544    74509: contig of 26966 bp in length.

--------------.
* NOTE: This record contains 90 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.
*        1      709: contig of 709 bp in length
*      710      809: gap of 100 bp
*      810     1538: contig of 729 bp in length
*     1539     1638: gap of 100 bp

            Medical Center Dr, Rockville, MD 20850, USA, cdtown@tigr.org
COMMENT     On Jan 19, 2001 this sequence version replaced gi:12280784.
            Address all correspondence to:at@tigr.org

            BAC clone F19K6 is from Arabidopsis thaliana chromosome 1
            The orientation of the sequence is from SP6 to T7 end of the BAC
            clone.
            Genes were identified by a combination of several methods: Gene
            prediction programs including Genscan+ (Chris Burge,
            http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (Mark Borodovsky,
            http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant
            of GlimmerM, see Mihaela Pertea,
            http://www.tigr.org/softlab/glimmerm_htm/glimmerm.html, and
            GeneSplicer (Mihaela Pertea and Steven Salzberg, contact
            mpertea@tigr.org), searches of the complete sequence against a
            peptide database and the plant EST database at TIGR
            (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to
            indicate the level of evidence for their annotation. Genes with
            similarity to other proteins are named after the database hits.
            Genes without significant peptide similarity but with EST
            similarity are named as  unknown  proteins. Genes without protein
            or EST similarity, that are predicted by more than two gene
            prediction programs over most of their length are annotated as
            hypothetical  proteins. Genes encoding tRNAs are predicted by
            tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).
            Simple repeats are identified by repeatmasker (Arian Smit,
            http://ftp.genome.washington.edu/RM/RepeatMasker.html).

  TITLE     Direct Submission
  JOURNAL   Submitted (23-NOV-2001) Whitehead Institute/MIT Center for Genome
            Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT     All repeats were identified using RepeatMasker:
            Smit, A.F.A. & Green, P. (1996-1997)
            http://ftp.genome.washington.edu/RM/RepeatMasker.html
            -------------- Genome Center
                Center: Whitehead Institute/ MIT Center for Genome Research
                Center code: WIBR
                Web site: http://www-seq.wi.mit.edu
                Contact: sequence_submissions@genome.wi.mit.edu
            -------------- Project Information
                Center project name: L17239
                Center clone name: 240_E_1
            --------------.
            * NOTE: This record contains 92 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      703: contig of 703 bp in length
            *      704      803: gap of 100 bp
            *      804     1542: contig of 739 bp in length
            *     1543     1642: gap of 100 bp
            *     1643     2377: contig of 735 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (10-FEB-2000) Whitehead Institute/MIT Center for Genome
            Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT     On Jul 13, 2000 this sequence version replaced gi:6958054.
            All repeats were identified using RepeatMasker:
            Smit, A.F.A. & Green, P. (1996-1997)
            http://ftp.genome.washington.edu/RM/RepeatMasker.html

                Center clone name: 366_G_3
            --------------.
            * NOTE: This record contains 80 individual   *
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      831: contig of 831 bp in length
            *      832      931: gap of 100 bp
            *      932     1803: contig of 872 bp in length
            *     1804     1903: gap of 100 bp
            *     1904     2772: contig of 869 bp in length
            *     2773     2872: gap of 100 bp

---------- Project Information
Center project name: L30037
Center clone name: 307_D_13
---------- Consensus Information
This consensus is derived from a shotgun assembly that has been manually curated. It is the best representation of the BAC that we can generate without further laboratory work. The draft assembly has been edited, and if possible, ends identified by vector as well as by BAC end sequences, and contigs ordered and oriented. Bases that are not Ns are either above Q20 or manually edited. This assembly was performed with Arachne (Genome Res. 2002 12: 177-189; Genome Res. 2003 13: 91-96). All trace files for this project are available at the NCBI trace repository (http://www.ncbi.nlm.nih.gov/Traces/trace.fcgi?). An exact list of reads used in this assembly are available at http://www.broad.mit.edu/annotation/plants/maize/randomclones.html.
----------.
* NOTE: This is a 'working draft' sequence. It currently
* consists of 2 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submittor.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.
* 1 17470: contig of 17470 bp in length
* 17471 17570: gap of unknown length
* 17571 78404: contig of 60834 bp in length.

COMMENT Address for correspondence: kaos@kazusa.or.jp
For the latest information on annotation of this clone, please see http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=MHM17
Genes with similarity to proteins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/Grail-1.3/), GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html), NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and SplicePredictor (Volker Brendel, Stanford University, http://gremlin1.zool.iastate.edu/cgi-bin/sp.cgi).
Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Washington University School of Medicine, St. Louis, http://genome.wustl.edu/eddy/tRNAscan-SE/).
This sequence may not be the entire insert of this clone. It may be shorter because we remove overlaps between neighboring submissions. The 5' clone is MPI10 and the 3' clone is MUL3.

            Medical Center Dr, Rockville, MD 20850, USA, rbuell@tigr.org
COMMENT     Address all correspondence to:potato@tigr.org

            BAC clone PGEC287I17 is from Solanum demissum chromosome 5
            The orientation of the sequence is from SP6 to T7 end of the BAC
            clone.
            Genes were identified by a combination of several methods: Gene
            prediction programs including Fgenesh (http://www.softberry.com/),
            genscan and Genscan+ (Chris Burge,
            http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (Mark Borodovsky,
            http://genemark.biology.gatech.edu/GeneMark/), and GeneSplicer
            (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org),
            searches of the complete sequence against a peptide database and
            the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml).
            Annotated genes are named to indicate the level of evidence for
            their annotation. Genes with similarity to other proteins are named
            after the database hits. Genes without significant peptide
            similarity but with EST similarity are named as  expressed
            proteins. Genes without protein or EST similarity, that are
            predicted by more than two gene prediction programs over most of
            their length are annotated as  hypothetical  proteins. Genes
            encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy,
            http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are
            identified by repeatmasker (Arian Smit,
            http://ftp.genome.washington.edu/RM/RepeatMasker.html).

            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
            was generated from part of bacterial clone contigs constructed by
            the MHC Haplotype Consortium and collaborators. Further information
            can be found at
            http://www.sanger.ac.uk/HGP/Chr6/MHC
            DAAP-188P13 is from a APD human bac - B Lymphoblastoid Cell Line
            library VECTOR: pBeloBAC11.

                Center clone name: 680_F_15
            -------------.
            * NOTE: This record contains 89 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.

  TITLE     Direct Submission
  JOURNAL   Submitted (19-JAN-2001) The Institute for Genomic Research, 9712
            Medical Center Dr, Rockville, MD 20850, USA, cdtown@tigr.org
COMMENT     On Jan 19, 2001 this sequence version replaced gi:12280777.
            Address all correspondence to:at@tigr.org

            BAC clone F17M19 is from Arabidopsis thaliana chromosome 1
            The orientation of the sequence is from SP6 to T7 end of the BAC
            clone.
            Genes were identified by a combination of several methods: Gene
            prediction programs including Genscan+ (Chris Burge,
            http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (Mark Borodovsky,
            http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant
            of GlimmerM, see Mihaela Pertea,
            http://www.tigr.org/softlab/glimmerm_htm/glimmerm.html, and
            GeneSplicer (Mihaela Pertea and Steven Salzberg, contact
            mpertea@tigr.org), searches of the complete sequence against a
            peptide database and the plant EST database at TIGR
            (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to
```

```
          indicate the level of evidence for their annotation. Genes with
          similarity to other proteins are named after the database hits.
          Genes without significant peptide similarity but with EST
          similarity are named as  unknown  proteins. Genes without protein
          or EST similarity, that are predicted by more than two gene
          prediction programs over most of their length are annotated as
          hypothetical  proteins. Genes encoding tRNAs are predicted by
          tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).
          Simple repeats are identified by repeatmasker (Arian Smit,
          http://ftp.genome.washington.edu/RM/RepeatMasker.html).

  TITLE     Direct Submission
  JOURNAL   Submitted (11-AUG-1999) P.falciparum Genome Sequencing Consortium,
            The Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge
            CB10 1SA, UK
COMMENT     On Aug 24, 1999 this sequence version replaced gi:5731892.
            For more information about this sequence or the Malaria Project,
            see http://www.sanger.ac.uk/Projects/P_falciparum. IMPORTANT: This
            sequence is unfinished and does not necessarily represent the
            correct sequence. Work on the sequence is in progress and the
            release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc.
            Order of segments is not known; 800 n's separate segments.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 12 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.

COMMENT     On Jan 13, 2005 this sequence version replaced gi:57506454.
            -------------- Genome Center
            Center: Wellcome Trust Sanger Institute
            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: zfish-help@sanger.ac.uk
            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep Clone-derived
            Zebrafish pUC subclones occasionally display inconsistency over the
            length of mononucleotide A/T runs and conserved TA repeats. Where
            this is found the longest good quality representation will be
            submitted.
            Repeat names beginning 'Dr' were identified by the Recon repeat
            discovery system (Zhirong Bao and Sean Eddy, submitted), and those
            beginning 'drr' were identified by Rick Waterman (Stephen Johnson
            lab, WashU).  For further information see
            http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml DKEY-72L19
            is from a Zebrafish BAC library

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 17 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.

DEFINITION  Arabidopsis thaliana DNA chromosome 4, P1 clone M4I22 (ESSA
            project).
ACCESSION   AL030978
VERSION     AL030978.1  GI:3269280
KEYWORDS    .
SOURCE      Arabidopsis thaliana (thale cress)
  ORGANISM  Arabidopsis thaliana
            Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;
            Spermatophyta; Magnoliophyta; eudicotyledons; core eudicotyledons;
            rosids; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

            --------------.
            * NOTE: This record contains 81 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
```

```
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.
*        1      972: contig of 972 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (16-MAY-2000) Yasukazu Nakamura, Kazusa DNA Research
            Institute, Department of Plant Gene Research; 1532-3, Yana,
            Kisarazu, Chiba 292-0812, Japan (E-mail:ynakamu@kazusa.or.jp,
            Tel:81-438-52-3935, Fax:81-438-52-3934)
COMMENT     Address for correspondence: kaos@kazusa.or.jp
            For the latest information on annotation of this clone, please see
            http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=MQC3
            Genes with similarity to proteins in the databases are described in
            'product' or 'note' qualifiers.  Genes that have no significant
            protein similarity are described as 'unknown protein'.
            The software programs used to predict genes include: Grail
            (Informatics Group, Oak Ridge National Laboratory,
            http://compbio.ornl.gov/Grail-1.3/),
            GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
            NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
            Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
            SplicePredictor (Volker Brendel, Stanford University,
            http://gremlin1.zool.iastate.edu/cgi-bin/sp.cgi).
            Genes encoding tRNAs are predicted by tRNAscan-SE
            (Sean Eddy, Washington University School of Medicine, St. Louis,
            http://genome.wustl.edu/eddy/tRNAscan-SE/).
            This sequence may not be the entire insert of this clone. It may be
            shorter because we remove overlaps between neighboring submissions.
            The 5' clone is T23B7 and the 3' clone is T16H11.

  JOURNAL   Submitted (27-FEB-2002) The Institute for Genomic Research, 9712
            Medical Center Dr, Rockville, MD 20850, USA, cdtown@tigr.org
COMMENT     On Apr 18, 2002 this sequence version replaced gi:6598612.
            On Oct 8, 1997 this sequence version replaced gi:2443866.
             We have determined that YAC YUP8H12 is chimaeric, and is comprised
             of two distinct genomic EcoRI fragments from chromosome I. This
             submission contains the sequence from the EcoRI site at position 1

             (right end) to position 181918 of our previous Phase II
             submission YUP8H12 accession number AC000098. This fragment maps
            at
             the bottom of the right arm of the chromosome between the ATHATPAS
             and m532 markers.

COMMENT     On May 19, 2005 this sequence version replaced gi:63003962.
            -------------- Genome Center
            Center: Department Of Chemistry And Biochemistry
            The University Of Oklahoma
            Center code:UOKNOR
            ----------------------.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 11 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     2187: contig of 2187 bp in length
            *     2188     2287: gap of unknown length
            *     2288     6238: contig of 3951 bp in length
            *     6239     6338: gap of unknown length
            *     6339     9805: contig of 3467 bp in length
            *     9806     9905: gap of unknown length
            *     9906    13302: contig of 3397 bp in length
            *    13303    13402: gap of unknown length
            *    13403    16872: contig of 3470 bp in length
            *    16873    16972: gap of unknown length
            *    16973    25035: contig of 8063 bp in length
            *    25036    25135: gap of unknown length
            *    25136    31808: contig of 6673 bp in length
            *    31809    31908: gap of unknown length
            *    31909    42068: contig of 10160 bp in length
            *    42069    42168: gap of unknown length
            *    42169    52548: contig of 10380 bp in length
            *    52549    52648: gap of unknown length
            *    52649    65724: contig of 13076 bp in length
            *    65725    65824: gap of unknown length
            *    65825    86869: contig of 21045 bp in length.

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 7 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     3369: contig of 3369 bp in length
            *     3370     3469: gap of unknown length
            *     3470     4416: contig of 947 bp in length
            *     4417     4516: gap of unknown length
            *     4517    15956: contig of 11440 bp in length
            *    15957    16056: gap of unknown length
            *    16057    30649: contig of 14593 bp in length
            *    30650    30749: gap of unknown length
            *    30750    50820: contig of 20071 bp in length
            *    50821    50920: gap of unknown length
            *    50921    83049: contig of 32129 bp in length
            *    83050    83149: gap of unknown length
            *    83150    89275: contig of 6126 bp in length.

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 15 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     4404: contig of 4404 bp in length

            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     On Jul 18, 2005 this sequence version replaced gi:70912565.
            -------------- Genome Center
                Center: Baylor College of Medicine
                Center code: BCM
                Web site: http://www.hgsc.bcm.tmc.edu/
                Contact: hgsc-help.tmc.edu
            -------------- Project Information
                Center project name: FJYT
                Center clone name: CH240-170G8
            -------------- Summary Statistics
                Sequencing vector: Plasmid;
                Chemistry: Dye-terminator Big Dye: 100% of reads
                Assembly program: Phrap; version 0.990329
                Consensus quality: 92849 bases at least Q40
                Consensus quality: 96310 bases at least Q30
                Consensus quality: 98411 bases at least Q20
                Estimated insert size: 118858; sum-of-contigs estimation
                Estimated insert size: 22369; agarose-fp estimation
                Quality coverage: 7x in Q20 bases; agarose-fp estimation
                Quality coverage: 1x in Q20 bases; sum-of-contigs estimation
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 25 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     5510: contig of 5510 bp in length
            *     5511     5610: gap of unknown length
            *     5611     8044: contig of 2434 bp in length
            *     8045     8144: gap of unknown length
            *     8145    10409: contig of 2265 bp in length
            *    10410    10509: gap of unknown length
            *    10510    12634: contig of 2125 bp in length
            *    12635    12734: gap of unknown length
            *    12735    17104: contig of 4370 bp in length
            *    17105    17204: gap of unknown length
            *    17205    20352: contig of 3148 bp in length
            *    20353    20452: gap of unknown length
            *    20453    27166: contig of 6714 bp in length
            *    27167    27266: gap of unknown length
            *    27267    30811: contig of 3545 bp in length
            *    30812    30911: gap of unknown length
            *    30912    33776: contig of 2865 bp in length

COMMENT     On Mar 1, 2002 this sequence version replaced gi:14916263.
            -------------- Genome Center
                Center: Washington University Genome Sequencing Center
                Center code: WUGSC
                Web site: http://genome.wustl.edu
                Contact: submissions@watson.wustl.edu
            -------------- Summary Statistics
                Center project name: H_NH0676D22
                Drafting Center: WIBR
            --------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-11 human BAC library was made from the blood of one male
            donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E.,
            Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved
            approach for construction of bacterial artificial chromosome
            libraries. Genomics 51:1-8. The clone may be obtained either from
            Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
            and coworkers at http://www.chori.org
            VECTOR:  pBACe3.6

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is RP11-92F20, 2000 bp overlap; the
            clone sequenced to the right is RP11-811O14.  Actual start of this
            clone is at base position 34064 of RP11-92F20; actual end is at
            base position 90621 of RP11-676D22.

            The sequence of AC025339 has been incorporated into AC092679.

            ---------- Project Information
                 Center project name: geq
                 Center clone name: 241H13
            ---------- Summary Statistics
                 Sequencing vector: plasmid; n/a; 100% of reads
                 Chemistry: Dye-terminator Big Dye; 100% of reads
                 Assembly program: Phrap; version 0.990319
                 Consensus quality: 85476 bases at least Q40
                 Consensus quality: 86471 bases at least Q30
                 Consensus quality: 87022 bases at least Q20
                 Insert size: 126000; agarose-fp
                 Insert size: 90296; sum-of-contigs
                 Quality coverage: 8.00x in Q20 bases; agarose-fp
                 Quality coverage: 11.16x in Q20 bases; sum-of-contigs
            ----------.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 9 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     3276: contig of 3276 bp in length
            *     3277     3376: gap of unknown length
            *     3377     6684: contig of 3308 bp in length
            *     6685     6784: gap of unknown length
            *     6785     8943: contig of 2159 bp in length
            *     8944     9043: gap of unknown length
            *     9044    11719: contig of 2676 bp in length
            *    11720    11819: gap of unknown length
            *    11820    15866: contig of 4047 bp in length
            *    15867    15966: gap of unknown length
            *    15967    34311: contig of 18345 bp in length
            *    34312    34411: gap of unknown length
            *    34412    40849: contig of 6438 bp in length
            *    40850    40949: gap of unknown length
            *    40950    59249: contig of 18300 bp in length
            *    59250    59349: gap of unknown length
            *    59350    91096: contig of 31747 bp in length.

            Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Jun 1, 1999 this sequence version replaced gi:4741573.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
            was generated from part of bacterial clone contigs of human
            chromosome X, constructed by the Sanger Centre Chromosome X Mapping
            Group.  Further information can be found at
            http://www.sanger.ac.uk/HGP/ChrX
            RP6-86H19 is from the library RPCI-6 constructed by the group of
            Pieter de Jong. For further details see
            http://www.chori.org/bacpac/home.htm
            VECTOR: pPAC4
            ---------- Genome Center

            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: vega@sanger.ac.uk
            ----------
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one subclone; and the assembly was confirmed by restriction digest,
            except on the rare occasion of the clone being a YAC.

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 15 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     6536: contig of 6536 bp in length

TITLE Direct Submission
JOURNAL Submitted (12-DEC-2003) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT On Dec 12, 2003 this sequence version replaced gi:38567348.
Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to confirm this sequence. Sequence data from the whole genome shotgun alone has only been used where it has a phred quality of at least 30.
---------- Genome Center
Center: Wellcome Trust Sanger Institute
Center code: SC
Web site: http://www.sanger.ac.uk
Contact: humquery@sanger.ac.uk

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the

```
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP24-319D9 is
            from a Male (C57BL/6J) mouse BAC Library VECTOR: pTARBAC1.

            ----------------------.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 3 contigs. Gaps between the contigs
            * are represented as runs of N. The order of the pieces
            * is believed to be correct as given, however the sizes
            * of the gaps between them are based on estimates that have
            * provided by the submittor.
            * This sequence will be replaced
            * by the finished sequence as soon as it is available and
            * the accession number will be preserved.
            *        1    56160: contig of 56160 bp in length
            *    56161    56260: gap of unknown length
            *    56261    70894: contig of 14634 bp in length
            *    70895    70994: gap of unknown length
            *    70995    92994: contig of 22000 bp in length.

* NOTE: This record contains 88 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

            Baylor Plaza, Houston, TX 77030, USA
COMMENT     -------------- Genome Center
                Center: Baylor College of Medicine
                Center code: BCM
                Web site: http://www.hgsc.bcm.tmc.edu/
                Contact: hgsc-help@bcm.tmc.edu
            -------------- Project Information
                Center project name: KCTF
                Center clone name: CH230-320N14
            -------------- Summary Statistics
                Sequencing vector: Plasmid;
                Chemistry: Dye-terminator Big Dye: 100% of reads
                Assembly program: Phrap; version 0.990329
                Consensus quality: 50389 bases at least Q40
                Consensus quality: 52929 bases at least Q30
                Consensus quality: 54643 bases at least Q20
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 49 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     1001: contig of 1001 bp in length
            *     1002     1101: gap of unknown length
            *     1102     2558: contig of 1457 bp in length
            *     2559     2658: gap of unknown length
            *     2659     3986: contig of 1328 bp in length
            *     3987     4086: gap of unknown length
            *     4087     5311: contig of 1225 bp in length
            *     5312     5411: gap of unknown length

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 27 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
```

```
          * be preserved.
          *        1      645: contig of 645 bp in length
          *      646      745: gap of unknown length
          *      746     1775: contig of 1030 bp in length
          *     1776     1875: gap of unknown length
          *     1876     2676: contig of 801 bp in length
          *     2677     2776: gap of unknown length
          *     2777     3592: contig of 816 bp in length
          *     3593     3692: gap of unknown length
          *     3693     4353: contig of 661 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (23-AUG-2000) Whitehead Institute/MIT Center for Genome
            Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT     On Aug 23, 2000 this sequence version replaced gi:9838013.
            All repeats were identified using RepeatMasker:
            Smit, A.F.A. & Green, P. (1996-1997)
            http://ftp.genome.washington.edu/RM/RepeatMasker.html

            Only 95546 base pairs from the middle of this clone are being
            submitted.  The remainder overlaps with either accession number
            AC006578 (WICGR project L754) or accession number AC005224 (WICGR
            project L354).

COMMENT
* NOTE: This is a 'working draft' sequence. It currently
* consists of 30 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

*	1	7116: contig of 7116 bp in length

  JOURNAL   Submitted (29-OCT-2002) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
COMMENT     -------------- Genome Center
                Center: Baylor College of Medicine
                Center code: BCM
                Web site: http://www.hgsc.bcm.tmc.edu/
                Contact: hgsc-help@bcm.tmc.edu
            -------------- Project Information
                Center project name: KDEN
                Center clone name: CH230-336D23
            -------------- Summary Statistics
                Sequencing vector: Plasmid;
                Chemistry: Dye-terminator Big Dye: 100% of reads
                Assembly program: Phrap; version 0.990329
                Consensus quality: 45003 bases at least Q40
                Consensus quality: 47218 bases at least Q30
                Consensus quality: 48140 bases at least Q20
            --------------
            * NOTE: Estimated insert size may differ from sequence length
            *   (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 49 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     1080: contig of 1080 bp in length
            *     1081     1180: gap of unknown length
            *     1181     2467: contig of 1287 bp in length
            *     2468     2567: gap of unknown length
            *     2568     3592: contig of 1025 bp in length
            *     3593     3692: gap of unknown length
            *     3693     4710: contig of 1018 bp in length
            *     4711     4810: gap of unknown length
            *     4811     6025: contig of 1215 bp in length

                Center code: WIBR
                Web site: http://www-seq.wi.mit.edu
                Contact: sequence_submissions@genome.wi.mit.edu
            -------------- Project Information
                Center project name: L6974
                Center clone name: 290_M_23
            --------------.
            * NOTE: This record contains 119 individual
            * sequencing reads that have not been assembled into
            * contigs. Runs of N are used to separate the reads
            * and the order in which they appear is completely
            * arbitrary. Low-pass sequence sampling is useful for
            * identifying clones that may be gene-rich and allows
            * overlap relationships among clones to be deduced.
            * However, it should not be assumed that this clone
            * will be sequenced to completion. In the event that
            * the record is updated, the accession number will
            * be preserved.
            *        1      764: contig of 764 bp in length

TITLE Direct Submission
JOURNAL Submitted (28-FEB-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
COMMENT On Sep 30, 2002 this sequence version replaced gi:23096711.
INFORMATION: http://www.hgsc.bcm.tmc.edu/ or email gc-help@bcm.tmc.edu

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

ANNOTATION OF FEATURES:
STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.
Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.
Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL:
http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html.

            Chiba, 292-0818, Japan (E-mail:ssato@kazusa.or.jp,
            URL:http://www.kazusa.or.jp/, Tel:81-438-52-3935(ex.2337),
            Fax:81-438-52-3934)
COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 21 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     5634: contig of 5634 bp in length
            *     5635     5734: gap of unknown length
            *     5735     6689: contig of 955 bp in length
            *     6690     6789: gap of unknown length
            *     6790     7816: contig of 1027 bp in length
            *     7817     7916: gap of unknown length
            *     7917    10345: contig of 2429 bp in length
            *    10346    10445: gap of unknown length
            *    10446    12278: contig of 1833 bp in length
            *    12279    12378: gap of unknown length
            *    12379    14486: contig of 2108 bp in length
            *    14487    14586: gap of unknown length
            *    14587    17300: contig of 2714 bp in length
            *    17301    17400: gap of unknown length
            *    17401    19679: contig of 2279 bp in length
            *    19680    19779: gap of unknown length
            *    19780    22506: contig of 2727 bp in length
            *    22507    22606: gap of unknown length
            *    22607    26758: contig of 4152 bp in length
            *    26759    26858: gap of unknown length
            *    26859    31414: contig of 4556 bp in length
            *    31415    31514: gap of unknown length
            *    31515    36792: contig of 5278 bp in length
            *    36793    36892: gap of unknown length
            *    36893    43034: contig of 6142 bp in length
            *    43035    43134: gap of unknown length
            *    43135    48654: contig of 5520 bp in length
            *    48655    48754: gap of unknown length
            *    48755    54036: contig of 5282 bp in length
            *    54037    54136: gap of unknown length
            *    54137    60104: contig of 5968 bp in length
            *    60105    60204: gap of unknown length
            *    60205    68811: contig of 8607 bp in length
            *    68812    68911: gap of unknown length
            *    68912    75850: contig of 6939 bp in length
            *    75851    75950: gap of unknown length
            *    75951    84281: contig of 8331 bp in length
            *    84282    84381: gap of unknown length
            *    84382    96464: contig of 12083 bp in length
            *    96465    96564: gap of unknown length
            *    96565    99104: contig of 2540 bp in length.

            gc-help@bcm.tmc.edu

            CLONE LENGTH: This sequence does not necessarily represent the
            entire insert of this clone. Overlapping regions of clones are only
            sequenced and submitted once, so the sequence for the remainder of
            the insert may be found in the record for the adjacent clones.
            Overlapping clones are noted at the beginning and end of the
            Features listing.

            ANNOTATION OF FEATURES:
               STSs are identified using ePCR (Genome Res. 7:541-550) searches
            of a local database that includes entries from dbSTS, GDB, and
            local mapping efforts.
               Repeats are identified using RepeatMasker (A. Smit and P. Green,
            unpublished.) for Human and Mouse sequences.
               Genes and Region of sequence similarity are identified by BLAST
            (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the
            EST and cDNA sequences. Genes demonstrate at least two exons
            flanked by consensus splice sites that maintained sequence
            continuity across the splice junctions. Sequences that are not
            identical matches are annotated as similar.

            SEQUENCING READ COVERAGE:Sequencing is completed to a minimum
            standard of double strand coverage with a minimum of 2 clones and 2
            reads with no ambiguities or 2 chemistries with a minimum of 2
            clones and 3 reads with no ambiguities. If the sequence quality for
            a region does not meet this standard, it will be indicated in the
            annotation as Low Coverage.

            QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality
            standards - estimated error rate less than 1 per 10,000 bases.
            Reports of lowest quality individual bases and measures of base
            quality are listed below. Description of the metrics can be found
            at URL:
            http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html.

COMMENT     On Oct 27, 2004 this sequence version replaced gi:54311989.
            -------------- Genome Center
            Center: Wellcome Trust Sanger Institute
            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: zfish-help@sanger.ac.uk
            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep Clone-derived
            Zebrafish pUC subclones occasionally display inconsistency over the
            length of mononucleotide A/T runs and conserved TA repeats. Where
            this is found the longest good quality representation will be
            submitted.
            Repeat names beginning 'Dr' were identified by the Recon repeat
            discovery system (Zhirong Bao and Sean Eddy, submitted), and those
            beginning 'drr' were identified by Rick Waterman (Stephen Johnson
            lab, WashU).  For further information see
            http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml DKEY-104K17

COMMENT     E. coli transposon insertion:The present data does not contain E.
            coli transposon sequences which integrated in the
            original/previous sequences.  We determined the boundary between
            the insertion and genomic sequences experimentally, removed the
            insertion sequences, reconstituted the present data. The sequencing
            project is supported by Japan Science Technology Corporation (JST)
            and The Institute of Physical and Chemical Research (RIKEN).

            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 8 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     1227: contig of 1227 bp in length

LOCUS       BX000688              102684 bp    DNA     linear   PRI 18-MAY-2005
DEFINITION  Human DNA sequence from clone DAQB-36F16 on chromosome 6 Contains
            the GPR53P pseudogene for G protein-coupled receptor 53, the OR2I1P
            pseudogene for olfactory receptor, family 2, subfamily I, member 1,
            the UBD gene for ubiquitin D, the OR2H5P pseudogene for olfactory
            receptor, family 2, subfamily H, member 5, the RPL13AP pseudogene
            for ribosomal protein L13a, the OR2H2 gene for olfactory receptor,
            family 2, subfamily H, member 2, the GABBR1 gene for
            gamma-aminobutyric acid (GABA) B receptor, 1, and 3 CpG islands,
            complete sequence.

            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
            was generated from part of bacterial clone contigs constructed by
            the MHC Haplotype Consortium and collaborators. Further information
            can be found at
            http://www.sanger.ac.uk/HGP/Chr6/MHC
            DAQB-36F16 is from a DNA-arts QBL human bac library VECTOR:
            pBeloBAC11
            -------------- Genome Center
            Center: Wellcome Trust Sanger Institute
            Center code: SC
            Web site: http://www.sanger.ac.uk
            Contact: vega@sanger.ac.uk
            --------------
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one subclone; and the assembly was confirmed by restriction digest,
            except on the rare occasion of the clone being a YAC.

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 25 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1      337: contig of 337 bp in length
            *      338      437: gap of unknown length
            *      438     1608: contig of 1171 bp in length
            *     1609     1708: gap of unknown length
            *     1709     3128: contig of 1420 bp in length
            *     3129     3228: gap of unknown length
            *     3229     4032: contig of 804 bp in length
            *     4033     4132: gap of unknown length
            *     4133     5629: contig of 1497 bp in length
            *     5630     5729: gap of unknown length
            *     5730     7114: contig of 1385 bp in length

            Contact: zfish-help@sanger.ac.uk
            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep Clone-derived
            Zebrafish pUC subclones occasionally display inconsistency over the
            length of mononucleotide A/T runs and conserved TA repeats. Where
            this is found the longest good quality representation will be
            submitted.
            Repeat names beginning 'Dr' were identified by the Recon repeat
            discovery system (Zhirong Bao and Sean Eddy, submitted), and those
            beginning 'drr' were identified by Rick Waterman (Stephen Johnson
            lab, WashU).  For further information see
```

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 22 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.

            Contact: zfish-help@sanger.ac.uk
            --------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep Clone-derived
            Zebrafish pUC subclones occasionally display inconsistency over the
            length of mononucleotide A/T runs and conserved TA repeats. Where
            this is found the longest good quality representation will be
            submitted.
            Repeat names beginning 'Dr' were identified by the Recon repeat
            discovery system (Zhirong Bao and Sean Eddy, submitted), and those
            beginning 'drr' were identified by Rick Waterman (Stephen Johnson
            lab, WashU).  For further information see
            http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml
            CH211-212N23 is from a CHORI-211 BAC library

  JOURNAL   Submitted (19-JAN-2001) The Institute for Genomic Research, 9712
            Medical Center Dr, Rockville, MD 20850, USA, cdtown@tigr.org
COMMENT     On Jan 19, 2001 this sequence version replaced gi:12280877.
            Address all correspondence to:at@tigr.org

            BAC clone T2E22 is from Arabidopsis thaliana chromosome 3
            The orientation of the sequence is from SP6 to T7 end of the BAC
            clone.
            Genes were identified by a combination of several methods: Gene
            prediction programs including Genscan+ (Chris Burge,
            http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (Mark Borodovsky,
            http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant
            of GlimmerM, see Mihaela Pertea,
            http://www.tigr.org/softlab/glimmerm_htm/glimmerm.html, and
            GeneSplicer (Mihaela Pertea and Steven Salzberg, contact
            mpertea@tigr.org), searches of the complete sequence against a
            peptide database and the plant EST database at TIGR
            (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to
            indicate the level of evidence for their annotation. Genes with
            similarity to other proteins are named after the database hits.
            Genes without significant peptide similarity but with EST
            similarity are named as  unknown  proteins. Genes without protein
            or EST similarity, that are predicted by more than two gene
            prediction programs over most of their length are annotated as
            hypothetical  proteins. Genes encoding tRNAs are predicted by
            tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).
            Simple repeats are identified by repeatmasker (Arian Smit,
            http://ftp.genome.washington.edu/RM/RepeatMasker.html).

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 38 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     1334: contig of 1334 bp in length
            *     1335     1434: gap of unknown length
            *     1435     2573: contig of 1139 bp in length
            *     2574     2673: gap of unknown length
            *     2674     3659: contig of 986 bp in length
            *     3660     3759: gap of unknown length
            *     3760     4757: contig of 998 bp in length
            *     4758     4857: gap of unknown length

            -------------
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variation annotation may not be found in the sequence submission
            corresponding to the overlapping clone, as we submit sequences with
            only a small overlap as described above.
            This sequence was finished as follows unless otherwise noted: all
            regions were either double-stranded or sequenced with an alternate
            chemistry or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by at least
            one plasmid subclone or more than one M13 subclone; and the
            assembly was confirmed by restriction digest, except on the rare
            occasion of the clone being a YAC.
            The following abbreviations are used to associate primary accession
            numbers given in the feature table with their source databases:
            Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
            on the WORMPEP database can be found at
            http://www.sanger.ac.uk/Projects/C_elegans/wormpep Repeat names
            beginning 'Dr' were identified by the Recon repeat discovery system
            (Zhirong Bao and Sean Eddy, submitted), and those beginning 'drr'
            were identified by Rick Waterman (Stephen Johnson lab, WashU).  For
            further information see http://www/Projects/D_rerio/fishmask.shtml
            DKEY-56L2 is from a Zebrafish BAC library
            VECTOR: pIndigoBAC-5.

COMMENT     On Nov 6, 2003 this sequence version replaced gi:21280340.
            Genes were predicted from the integrated results of the following:
            GENSCAN (http://CCR-081.mit.edu/GENSCAN.html), FGENESH
            (http://www.softberry.com/), GeneMark.hmm
            (http://opal.biology.gatech.edu/GeneMark/), GlimmerM
            (http://www.tigr.org/tdb/glimmerm/glmr_form.html), RiceHMM
            (http://rgp.dna.affrc.go.jp/RiceHMM/), SplicePredictor
            (http://bioinformatics.iastate.edu/cgi-bin/sp.cgi), sim4
            (http://globin.cse.psu.edu/html/docs/sim4.html), gap2
            (http://www.tigr.org/software/glimmerm/), BLASTN and BLASTX. The
            genomic sequence was searched against NCBI NonRedundant Protein
            database, nr (ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA
            sequence database at RGP or DDBJ. Protein homologies of the coding
            regions were searched against NCBI NonRedundant Protein database
            with BLASTP. ESTs represent the identified cDNA sequences using
            BLASTN with the corresponding DDBJ accession no. and RGP clone ID.
            Full-length cDNAs represent the identified cDNA sequences using
            BLASTN with the corresponding DDBJ accession no.
            A gene with identity or significant homology to a protein is
            classified based on the protein name to indicate the homology level
            such as same name, 'putative-' and '-like protein'.  A gene without
            significant homology to any protein but with full-length cDNA or
            EST homology (covering almost the entire length of partial
            sequence) is classified as an 'unknown' protein. A gene predicted
            by two or more gene prediction programs is classified as a
            'hypothetical' protein according to IRGSP standard. A gene
            predicted by a single gene prediction program is also classified as
            a probable 'hypothetical' protein and is included as a
            miscellaneous feature of the sequence.
            The orientation of the sequence is from M13rev to -21M13 of the BAC
            clone. This sequence of OJ1282_E10 clone has an overlap with
            OJ1149_C12 (DDBJ: AP004082) clone at 5' end and with P0264G11
            (DDBJ: AP006187) at 3' end. The sequence was generated by combining
            Monsanto and RGP-Japan sequencing data. Detailed information on
            overlap and assembly quality together with annotation of this entry
            is available at
            http://rgp.dna.affrc.go.jp/GenomeSeq.html.

COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 34 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.
            *        1     1522: contig of 1522 bp in length
            *     1523     1622: gap of unknown length
            *     1623     2481: contig of 859 bp in length
            *     2482     2581: gap of unknown length

            -------------- Genome Center
                Center: Washington University Genome Sequencing Center
                Center code: WUGSC
                Web site: http://genome.wustl.edu
                Contact: submissions@watson.wustl.edu
            -------------- Summary Statistics
                Center project name: H_NH0638D14
            --------------.

            NOTICE:

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded, sequenced with an alternate
            chemistry, or covered by high quality data (i.e., phred quality >=
            30); an attempt was made to resolve all sequencing problems, such
            as compressions and repeats; all regions were covered by sequence
            from more than one subclone; and the assembly was confirmed by
            restriction digest.

            MAPPING INFORMATION:
            Mapping information for this clone was provided by Dr. Wes Warren,
            Department of Genetics, Washington University, St. Louis MO. For
            additional information about the map position of this sequence, see
            http://genome.wustl.edu

            SOURCE INFORMATION:
            The RPCI-11 human BAC library was made from the blood of one male
            donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E.,
            Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved
            approach for construction of bacterial artificial chromosome
            libraries. Genomics 51:1-8. The clone may be obtained either from
```

```
            Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
            and coworkers at http://www.chori.org
            VECTOR:  pBACe3.6

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is RP11-789A18, 2000 bp overlap;
            the clone sequenced to the right is RP11-515K12, 2000 bp overlap.
            Actual start of this clone is at base position 146042 of
            RP11-789A18; actual end is at base position 23686 of RP11-515K12.

            Polymorphisms have been identified between AC093113 and AC103881.

            A transposon was identified in a growth of the clone RP11-638D14,
            which is not a part of the submitted sequence.

COMMENT     On Jan 19, 2001 this sequence version replaced gi:12280822.
            Address all correspondence to:at@tigr.org

            BAC clone F5A18 is from Arabidopsis thaliana chromosome 1
            The orientation of the sequence is from SP6 to T7 end of the BAC
            clone.
            Genes were identified by a combination of several methods: Gene
            prediction programs including Genscan+ (Chris Burge,
            http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHMM (Mark Borodovsky,
            http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant
            of GlimmerM, see Mihaela Pertea,
            http://www.tigr.org/softlab/glimmerm_htm/glimmerm.html, and
            GeneSplicer (Mihaela Pertea and Steven Salzberg, contact
            mpertea@tigr.org), searches of the complete sequence against a
            peptide database and the plant EST database at TIGR
            (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to
            indicate the level of evidence for their annotation. Genes with
            similarity to other proteins are named after the database hits.
            Genes without significant peptide similarity but with EST
            similarity are named as  unknown  proteins. Genes without protein
            or EST similarity, that are predicted by more than two gene
            prediction programs over most of their length are annotated as
            hypothetical  proteins. Genes encoding tRNAs are predicted by
            tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).
            Simple repeats are identified by repeatmasker (Arian Smit,
            http://ftp.genome.washington.edu/RM/RepeatMasker.html).

            Fax:81-438-52-3934)
COMMENT     * NOTE: This is a 'working draft' sequence. It currently
            * consists of 29 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.

            ----------------------.
            * NOTE: This is a 'working draft' sequence. It currently
            * consists of 5 contigs. Gaps between the contigs
            * are represented as runs of N. The order of the pieces
            * is believed to be correct as given, however the sizes
            * of the gaps between them are based on estimates that have
            * provided by the submittor.
            * This sequence will be replaced
            * by the finished sequence as soon as it is available and
            * the accession number will be preserved.
            *        1    26038: contig of 26038 bp in length
            *    26039    26138: gap of unknown length
            *    26139    44595: contig of 18457 bp in length
            *    44596    44695: gap of unknown length
            *    44696    59111: contig of 14416 bp in length
            *    59112    59211: gap of unknown length
            *    59212    81059: contig of 21848 bp in length
            *    81060    81159: gap of unknown length
            *    81160   109715: contig of 28556 bp in length.

            Physical and Chemical Research (RIKEN), Laboratory for Genome
            Exploration Research Group, RIKEN Genomic Sciences Center (GSC),
            RIKEN Yokohama Institute; 1-7-22 Suehiro-cho, Tsurumi-ku, Yokohama,
            Kanagawa, 230-0045, Japan (E-mail:genome-res@gsc.riken.jp,
            URL:http://genome.gsc.riken.jp, Tel:81-45-503-9222,
            Fax:81-45-503-9216)
COMMENT     Alternative Splicing Libraries (ASLs) are prepared by: Preparating
            of single-stranded DNA using a RNA template from full length cDNA
            libraries, hybridizating of
            single-stranded DNAs, removing of remaining single-stranded DNA,
            digesting of regions comprising double-stranded DNA by a set of 4
            bp-cutters, capturing of DNA hybrids with loop structures
            (alternative spliced exon), ligating of Y-shaped primers to
            isolated DNA hybrids with loop structures, PCR amplification of
            ligation products and their cloning into pFLCI vector. (Reference).

pBlueScript backbone); Site_1: BamHI; Site_2: BglII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'http://www.mutransposon.org/project/RescueMu/'. Grid V was grown at University of Arizona in 2003. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

                     strand cDNA was primed with a Not I - oligo(dT) primer [5'
                     TGTTACCAATCTGAAGTGGGAGCGGCCGCGCTTTTTTTTTTTTTTTTTT 3'],
                     double-stranded cDNA was size selected, ligated to Eco RI
                     adapters (Pharmacia), digested with Not I and cloned into
                     the Not I and Eco RI sites of a modified pT7T3 vector
                     (Pharmacia). Library went through one round of
                     normalization to a Cot = 53. Library constructed by Bento
                     Soares and M.Fatima Bonaldo. The adult brain RNA was
                     provided by Dr. Donald H. Gilden. Tissue was acquired
                     17-18 hours after death which occurred in consequence of a
                     ruptured aortic aneurysm. RNA was prepared from a pool of
                     tissues representing the following areas of the brain:
                     frontal, parietal, temporal and occipital cortex from the
                     left and right hemispheres, subcortical white matter,
                     basal ganglia, thalamus, cerebellum, midbrain, pons and
                     medulla."

                     /note="Vector: pBRcDNASfiAB; The library was constructed
                     from 10 different sources of RNA from a single genotype.
                     Separate cDNAs were generated using primers that
                     incorporated unique 5' and 3' tags to distinguish each
                     source of RNA. cDNAs were then pooled, size-fractionated,
                     directionally cloned into a custom medium-copy vector and
                     transformations made with four size classes to minimize
                     size bias. Details of each source of RNA and library
                     construction can be obtained at http://cgpdb.ucdavis.edu/

/note="Vector: Lambda Uni-ZAP XR, excised phagemid; Site_1: EcoRI; Site_2: XhoI; Seeds of barley (Hordeum vulgare L. cv. Dicktoo) were germinated in dishpans containing UCR-mix soil. Seedlings were kept in a growth chamber at 20C (day/night) and allowed to grow at 60-70% soil moisture content. After 3-4 days, the water was withheld in order to apply drought until the soil moisture content was reduced to 10-12%, which took another 3-4 days. At the time of extraction of epidermis, leaf water and osmotic potentials and extracted lower epidermis osmotic potentials had dropped to 15.9%, 20.2% and 24.7% of controls, respectively, as determined using a vapor pressure osmometer (Model 5100C, Wescor, Inc., Logan, UT). Epidermal strips were quickly peeled off of seedlings and immediately submerged in liquid nitrogen. About 15-20 g of epidermal tissue was collected and used to extract total RNA. Total RNA was extracted using Concert Plant RNA Reagent (Invitrogen 12322-012). Poly(A) RNA was purified using PolyATrack mRNA Isolation System IV (Promega). A cDNA library was made using a Uni-ZAP cDNA synthesis kit (Stratagene). A total of 1 million primary lambda cDNA clones were mass-excised in vivo to give a population of pBluescript SK(-) phagemids. All steps to this point were performed in the TJ Close lab at the University of California, Riverside by A. Wahid with some assistance from R.D. Fenton. Phagemids were plated on the TJC121 host strain, plasmid DNA purified, cDNA clones archived, and DNA sequences determined using the T7 primer (mainly 3' end reads) using an ABI3730 at the Arizona Genomics Institute, University of Arizona (Collura, Feuerbacher, Kim, Kudrna, Wing, Yu). Chromatogram files were transmitted to UC Riverside (by Yu), then processed at UC Riverside (by Wanamaker) using the HarvEST pipeline (http://harvest.ucr.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region. Sequences that retained a phred 17 region of at least 100 bases were deposited to GenBank."

  TITLE     Direct Submission
  JOURNAL   Submitted (23-OCT-2003) Balzergue S., UMRGV, INRA/CNRS, 2 rue
            Gaston Cremieux, 91057 Evry cedex, FRANCE
COMMENT     PCR was performed on DNA from transformants of Arabidopsis thaliana
            plants from INRA (Versailles). The DNA fragment(s) resulting from
            the PCR were directly sequenced from the left or the right border
            to determine the genomic sequence flanking the insertion. T-DNA
            derived sequences were removed. Information to order the
            corresponding mutant line and a link to a database providing a
            graphical display of the insertion site are available at
            http://dbsgap.versailles.inra.fr/publiclines/. This sequence has
            been generated in the framework of the French plant genomics
            program 'Genoplante' (http://www.genoplante.com and
            http://genoplante-info.infobiogen.fr).

/note="Site_1: XhoI; Site_2: SstI; cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. 1st strand cDNA was primed with a primer [5' GAGAGAGAGAAGGATCCAAGAGCTCTTTTTTTTTTTTTTTVN 3'], cDNA was

prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. Second strand cDNA was prepared with the primer adapter of sequence [5' GAGAGAGAGATTCTCGAGTTAATTAAATTAATCCCCCCCCCCCCCC 3']. cDNA was cleaved with XhoI and SstI. "

            An Arabidopsis full-length cDNA library was constructed essentially
            as reported previously (Seki et al., 1998).cDNA cleaved with BamHI
            and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
            al., submitted for publication) digested with BamHI and SalI. This
            clone is in a modified pBluescript vector. Please visit our web
            site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further
            details.

JOURNAL Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany
COMMENT This sequence has been recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by BAC clone f17h15. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
```

                      /note="Vector: pBRcDNASfiAB; The library was constructed
                      from 10 different sources of RNA from a single genotype.
                      Separate cDNAs were generated using primers that
                      incorporated unique 5' and 3' tags to distinguish each
                      source of RNA. cDNAs were then pooled, size-fractionated,
                      directionally cloned into a custom medium-copy vector and
                      transformations made with four size classes to minimize
                      size bias. Details of each source of RNA and library
                      construction can be obtained at http://cgpdb.ucdavis.edu/

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See

            All clones with suffix q1c are reverse primer reads starting at 5'
            end of the cDNA all p1c reads are from
            the 3' end.

                     /clone_lib="MtBA"
                     /note="Vector: pBluescript pSK; Site_1: EcoRI; Site_2:
                     XhoI; Plants were grown in an aeroponic chamber for 14
                     days on nitrogen-rich medium followed by 3 days on N-free
                     medium. RNA was extracted from root tips (1-3 cm). cDNA
                     was prepared from polyA+ enriched RNA. The cDNA was
                     directionally ligated into Uni-zapXR vector from
                     Stratagene and packaged using Gigapack Gold packaging
                     extracts. Plasmids containing cDNA inserts were
                     mass-excised from phage stocks using ExAssit helper phage
                     and propagated in SOLR cells. Clone ordering and
                     sequencing was performed by the Centre National de
                     Sequencage (Genoscope, Evry, France)."

                     whole plant cDNA library"
                     /note="Vector: Lambda Uni-ZAP XR, excised phagemid;
                     Site_1: EcoRI; Site_2: XhoI; Plants were grown in a growth
                     chamber at North Dakota State University (Kianian, Otto,
                     Simons). Tissues collected from seven-day etiolated
                     seedling leaf, stem, root and seed; leaf from plant at
                     fourth leaf stage; spike from pre-anthesis through 20
                     days after anthesis; flag leaf; leaf and stem tissue from
                     tillers. and root. Total RNA and poly(A) RNA were
                     prepared from each tissue and then pooled, a cDNA library
                     was made, and the cDNA clones were in vivo excised to give
                     pBluescript phagemids in the TJ Close lab (Akhunov, Chin,
                     Choi, Close, Fenton, Kianian, Otto, Simons, Zhang) at the
                     University of California, Riverside. Plasmid DNA
                     preparations and DNA sequencing were performed in the OD
                     Anderson lab (all other authors)."

Computational Analysis of Full-Length Mouse cDNAs Compared with Human Genome Sequences Mamm. Genome. 12, 673-677 (2001)
Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)
RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)
Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001)
cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.
Please visit our web site (http://genome.gsc.riken.go.jp) for further details.

An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998, 2002).This clone is in a modified pBluescript vector.
Please visit our web site (http://pfgweb.gsc.riken.jp and http://rarge.gsc.riken.jp) for further details.

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See
            www.nematode.net for additional project information.

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See
            www.nematode.net for additional project information.

/note="Vector: pBluescript SK-; Site_1: EcoRI; Site_2: XhoI; At the trifoliate stage, M. truncatula plants were transplanted to phosphate-free sand and grown for a further 30 days. During this period, they were fertilized twice weekly with 1/2 Hoaglands solutions containing 20uM potassium phosphate. cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propagated in XLOLR cells."

                     /db_xref="taxon:3847"
                     /clone="GENOME SYSTEMS CLONE ID: Gm-c1054-1024"
                     /tissue_type="Leaf, 3 week old, greenhouse grown"
                     /lab_host="DH10B"
                     /clone_lib="Gm-c1054"
                     /note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
                     XhoI; The Harosoy NIL was constructed and seed was
                     provided by Dr. J. Specht, University of Nebraska
                     (Shoemaker and Specht, 1995). The cDNA library was
                     constructed from mRNA isolated from leaf tissue at various
                     developmental stages of 3 week old greenhouse grown
                     plants. Complementary DNA was  synthesized from mRNA using
                     a primer consisting of a poly(dT) sequence  with a XhoI
                     restriction site and a 3' anchor. EcoRI adapters were
                     ligated  to the blunt-ended cDNA fragments followed by
                     XhoI digestion. The cDNA  fragments were directionally
                     cloned into the EcoRI-XhoI restriction site of  the
                     pBluescript vector. The ligated cDNA fragments were
                     transformed into  DH10B host cells (GibcoBRL). This
                     library was constructed in cooperation  with Dr. Paul
                     Keim's laboratory at Northern Arizona University."

                      /lab_host="XL10-Gold"
                      /clone_lib="Gm-c1004"
                      /note="Vector: pBluescript II XR; Site_1: EcoRI; Site_2:
                      XhoI; Root cDNA. The mRNA was isolated from entire roots
                      of 8 day old 'Williams' seedlings which were propagated on
                      paper towels with distilled water. Stratagene's  cDNA
                      Synthesis Kit (catalog #200401) was used to synthesize the
                      cDNA. First- strand synthesis was performed with 5-methyl
                      dCTP, hence the ligated cDNA is hemimethylated.
                      Stratagene's first-strand synthesis primer was used
                      [GAGAGAGAGAGAGAGAGAACTAGTCTCGAG(T)-18]. After
                      second-strand synthesis, the cDNA ends were 'polished'
                      with clone Pfu DNA polymerase, ligated to EcoRI adapters,
                      and phosphorylated. The XhoI site within the first-strand
                      synthesis primer was restricted by digestion with XhoI;
                      all XhoI sites in the  cDNA would be protected by their
                      hemimethylated status. The cDNA constructs were
                      size-fractionated with a 500bp cutoff, using GibcoBRL Life
                      Technologies' cDNA Size Fractionation column. The column
                      eluent was then ligated into  Stratagene's pBluescript II
                      XR Predigested vector (pBluescript II SK(+) that had been
                      digested with EcoRI and XhoI, and phosphorylated). Both
                      the white  and blue colonies appear to contain recombinant
                      plasmids with cDNA inserts. Blue colonies 9n=15) have been
                      sequenced, and possess putative cDNA inserts. This library
                      was constructed by Dr. Paul Keim & Virginia H. Coryell,
                      Department of Biology, Box5640, Northern Arizona
                      University, Flagstaff, AZ 86011, Phone: 520-523-1078 (Dr.

                     Glycine max genomic clone"
                     /note="Vector: pBeloBAC11; The ISU BAC library (Marek and
                     Shoemaker, Genome 40:420, 1997) was constructed using the
                     HindIII site in pBeloBAC11. The library consists of
                     approximately 40,000 clones with an average insert size of
                     150 Kb, equal to 4 haploid genome equivalents. Screening
                     of the library is done by hybridization of high-density
                     colony filters. Two high density filters, each containing
                     18,432 clones (doubly spotted) represent the portion of
                     the library screened"

                     /clone_lib="Gm-c1066"
                     /note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
                     XhoI; The cDNA library was constructed from mRNA isolated
                     from unexpanded leaves and the shoot tips of 2 week old
                     seedling from the cultivar Williams. The 2 week old
                     seedlings were salt stressed in a solution of 500mM NaCl
                     for 3 days prior to harvesting. Complementary DNA was
                     synthesized from mRNA using a  primer consisting of a
                     poly(dT) sequence with a XhoI restriction site. EcoRI
                     adapters were ligated to the blunt-ended cDNA fragments
                     followed by XhoI  digestion. The cDNA fragments were
                     directionally cloned into the EcoRI-XhoI  restriction site
                     of the pBluescript vector. The ligated cDNA fragments were
                     transformed into DH10B host cells (GibcoBRL). This library
                     was constructed  in the laboratory of Dr. Randy
                     Shoemaker."

            An Arabidopsis full-length cDNA library was constructed essentially
            as reported previously (Seki et al., 1998). cDNA cleaved with BamHI
            and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
            al., submitted for publication) digested with BamHI and SalI. This
            clone is in a modified pBluescript vector. Please visit our web
            site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further
            details.

                     /note="Vector: pBRcDNASfiAB; The library was constructed
                     from 10 different sources of RNA from a single genotype.
                     Separate cDNAs were generated using primers that
                     incorporated unique 5' and 3' tags to distinguish each
                     source of RNA. cDNAs were then pooled, size-fractionated,
                     directionally cloned into a custom medium-copy vector and
                     transformations made with four size classes to minimize
                     size bias. Details of each source of RNA and library
                     construction can be obtained at http://cgpdb.ucdavis.edu/

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See
            www.nematode.net for additional project information.
            Putative full length read
            The vector to vector length is 433
            Seq primer: Sp6.

            Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany
COMMENT     This sequence has been recovered from the left border of the T-DNA.
            It indicates an insertion within the locus defined by BAC clone
            f17h15. Details on the protocols used for generation of the
            sequence are described in References 1-3. The sequences are
            generated at the MPI for Plant Breeding Research in the context of
            the GABI-Kat project. GABI-Kat is part of the German Plant Genomics
            program designated 'GABI'. Information on line availability can be
            found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.

                     from 9-11 day old seedlings that were induced for HR
                     (hypersensitive response) by vacuum infiltrating plant
                     tissue with Pseudomonas syringae pv. glycinea carrying the
                     avrB gene (Genetics 141:1597-1604). Plant tissue (expanded
                     unifoliate leaves) was collected at 2, 4, 8, 12, 24, 36,
                     and 53 hrs after inoculation and their mRNA pooled equally
                     for cDNA construction. The  library was prepared using the
                     Stratagene pBluescript II SK(+) library construction kit.
                     Complementary DNA was synthesized from mRNA using a primer
                     consisting of a poly(dT) sequence with an XhoI restriction
                     site. EcoRI adaptors were ligated to the blunt-ended cDNA
                     fragments followed by XhoI digestion. The cDNA insert is
                     protected from XhoI digestion via methylation during first
                     strand synthesis. The cDNA fragments were directionally
                     cloned into the EcoRI-XhoI restriction site of the
                     pBluescript vector. The ligated cDNA fragments were
                     transformed into E.coli ElectroMax DH10B host cells. Plant
                     care, inoculations, and library construction were
                     performed by Steve Clough (Lila Vodkin lab, University of
                     Illinois)."

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See
            www.nematode.net for additional project information.

                      /clone="GENOME SYSTEMS CLONE ID: Gm-c1056-1074"
                      /tissue_type="Whole seedling, 4 day old"
                      /lab_host="DH10B"
                      /clone_lib="Gm-c1056"
                      /note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
                      XhoI; The cDNA library was constructed from mRNA isolated
                      from 4 day old seedling of PI468916. The seedlings were
                      germinated in a growth chamber using germination paper.
                      Complementary DNA was synthesized from mRNA using a primer
                      consisting of a poly(dT) sequence with a XhoI restriction
                      site. EcoRI adapters were ligated to the blunt-ended cDNA
                      fragments followed by XhoI digestion. The cDNA fragments
                      were directionally cloned into the EcoRI-XhoI restriction
                      site of the pBluescript vector. The ligated cDNA fragments
                      were transformed into DH10B host cells (GibcoBRL). This
                      library was constructed in the  laboratory of Dr. Randy
                      Shoemaker."

Cloned unidirectionally. Poly (A)+ RNA was concentrated and purified using Dynabeads (Dynal) and mRNA eluted for 1ST strand synthesis. 1st strand cDNA created using MMLV RT(PowerScript, CLontech) and primed with oligo(dT) with XhoI site (primer CDSIII/3-XhoI) and 5' SMART anchor added using chimeric DNA-RNA oligo (SMART-NotI-r-GGG). SMART-NotI-r-GGG was used in case a PCR using the SMART template was also desired. 15 PCR cycles were done using 1st strand and primers specific to SL1 leader sequence (SL1-NotI) and 3' end (XhoI-No-dT). dscDNA was digested using XhoI/NotI, fractionated on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM -11zf(+) plasmid. Chemically competent cells were used as host. This library was provided by David Bird's lab (david_bird@ncsu.edu), of North Carolina State University.

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See
            www.nematode.net for additional project information.

An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998). cDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et al., submitted for publication) digested with BamHI and SalI. This clone is in a modified pBluescript vector. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further details.

                     /note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
                     XhoI; The mRNA was isolated from roots of bulked Minsoy x
                     Noir RI progeny that are phenotypically susceptible to
                     flooding damage. The plants were flooded (submerged) for
                     24 hours prior to harvest. Dr. Tara VanToai generously
                     provided the isolated mRNA. The roots were flash- frozen
                     in liquid nitrogen. Stratagene's cDNA Synthesis Kit
                     (catalog number 200401) was used to synthesize the cDNA.
                     First-strand synthesis was performed with 5-methyl dCTP,
                     hence the ligated cDNA was hemimethylated. A modification
                     of Stratagene's first-strand synthesis primer was used. An
                     'anchor' nucleotide (V=A, C, or G) was added to the 3' end
                     of the primer [GAGAGAGAGAGAGAGAGAACTAGTCTCGAG(T)18V] to
                     anchor the primer at the 5' end of the poly(A) tract.
                     After second-strand synthesis, the cDNA ends were filled
                     in with cloned Pfu DNA, ligated to EcoRI adapters and
                     subsequently phosphorylated. The cDNA was then
                     precipitated and redissolved in sterile, RNase-,
                     DNase-free water. The XhoI site within the first- strand
                     synthesis primer was then restricted by digestion with
                     XhoI from Promega (40U/ul); all XhoI sites in the cDNA
                     would be protected by their hemimethylated status. The
                     cDNA constructs were size-fractionated with a 500bp
                     cutoff, using Sephacryl S-500 High Resolution (Pharmacia
                     Biotech) in a 2-mm diameter column and a bed volume of
                     approximately 1ml. The column eluent was precipitated,
                     redissolved, and ligated into Stratagene's pBluescript II
                     XR Predigested vector (pBluescript II SK(+) vector that
                     has been digested with EcoRI and XhoI, and phosphorylated
                     by Stratagene). This library was constucted in the
                     laboratory of Dr. Paul Keim and Dr. Virginia H. Coryell at
```

Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified using Dynabeads (Dynal) and mRNA eluted for first strand synthesis. First strand cDNA was created using MMLV RT (Powerscript, Clontech) and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added using chimeric DNA-RNA oligo. 12 PCR cycles were done using first strand and primers specific to SMART oligo and 3' end. Double stranded cDNA was digested using XhoI/NotI, fractioned on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as host cells. Library materials provided by Dr. David Bird of North Carolina State University. Library construction by Jeff Rousch. See www.nematode.net for additional project information.

                      from 11 different sources of RNA from a single genotype.
                      Separate cDNAs were generated using primers that
                      incorporated unique 5' and 3' tags to distinguish each
                      source of RNA. cDNAs were then pooled, size-fractionated,
                      directionally cloned into a custom medium-copy vector and
                      transformations made with four size classes to minimize
                      size bias. Details of each source of RNA and library
                      construction can be obtained at http://cgpdb.ucdavis.edu/

```

RI; 1st strand cDNA was primed with a Not I - oligo(dT) primer [5' TGTTACCAATCTGAAGTGGGAGCGGCCGCATTTTTTTTTTTTTTTTTT 3'], double-stranded cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library constructed by Bento Soares and M.Fatima Bonaldo. RNA from 4 multiple sclerosis lesions from one patient was kindly provided by Dr. Kevin G. Becker (NINDS/NIH). "

                     /clone_lib="Gm-c1034"
                     /note="Vector: pSPORT1; Site_1: NotI; Site_2: SalI; This
                     cDNA library was constructed from mRNA isolated from very
                     young seed coats (20-50mgs fresh weight) of greenhouse
                     grown plants. The library was prepared using the Life
                     Technologies pSuperScript cDNA library construction kit.
                     Complementary DNA was synthesized from mRNA using a
                     poly(dT) sequence with a NotI restrictions site. SalI
                     linkers adapters were ligated to the blunt-ended cDNA
                     fragments followed by NotI digestion. The cDNA fragments
                     were directionally cloned into the NotI-SalI restriction
                     site of the pSPORT1 vector. The ligated cDNA fragments
                     were  transformed into E.coli ElectroMax DH10B host cells.
                     This library  was constructed by Dr. Lila Vodkin and Dr.
                     Anu Khanna."

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See
            www.nematode.net for additional project information.
            Putative full length read

                     inoculation with Sinorhizobium meliloti, the medium was
                     replaced by N-free medium. Root nodules (+ short adjacent
                     root segments) were harvested 4 days post inoculation.
                     cDNA was prepared from polyA+ enriched RNA. The cDNA was
                     directionally ligated into Uni-zap XR vector from
                     Stratagene and packaged using Gigapack Gold packaging
                     extracts. Plasmids containing cDNA inserts were
                     mass-excised from phage stocks using ExAssit helper phage
                     and propagated in SOLR cells. Clone ordering and
                     sequencing was performed by the Centre National de
                     Sequencage (Genoscope, Evry, France)."

            cDNA Library Preparation: Matthew Clark. cDNA Library Arrayed by:
            Matthew Clark. DNA Sequencing by: Washington University Genome
            Sequencing Center Clone distribution: Genome Systems, St. Louis,
            Missouri (web address: www.genomesystems.com) (email contact:
            info@genomesystems.com) and Research Genetics, Huntsville, Alabama
            (web address: www.resgen.com) (email contact: info@resgen.com) and
            RessourcenZentrumPrimarDatenbank, Berlin, Germany (web address:
            www.rzpd.de)
            Seq primer: T7 ET from Amersham
            High quality sequence stop: 433.
FEATURES             Location/Qualifiers
     source          1. .452
                     /organism="Danio rerio"
                     /mol_type="mRNA"
                     /db_xref="taxon:7955"
                     /clone="IMAGE:3722819"
                     /sex="mixed"
                     /tissue_type="26 somite embryos, adult livers, shield
                     stage embryos"
                     /lab_host="XL1-blue MRF"
                     /clone_lib="Zebrafish WashU MPIMG EST"
                     /note="Vector: pSPORT1; Site_1: NotI; Site_2: SalI; 1st
                     strand cDNA was primed with a Not I - oligo(dT)15 primer
                     [5'pGACTAGTTCTAGATCGCGAGCGGCCGCCCTTTTTTTTTTTTTT3']
                     double-stranded cDNA was ligated to Sal I adaptors (BRL),
                     digested with Not I and cloned into the Not I and Sal I
                     sites of the pSPORT1 vector (BRL). Library was constructed
                     by Matthew Clark (Lehrach lab; ICRF, London and Max Planck
                     Institut fuer Molekulare Genetik,Berlin). cDNAs for EST
                     analysis were selected following oligonucleotide
                     hybridization fingerprinting of arrayed clones from
                     zebrafish late somitogenesis (26 ss), adult liver or
                     embryonic shield stage (5.6 h) libraries. Fingerprint
                     data were used to computationally cluster cDNAs, and a
                     single cDNA from each cluster was chosen for sequencing.
                     In some cases multiple members of the same cluster were
                     sequenced to assess clustering parameters or single clones
                     were sequenced additional times to assess quality
                     control."

            Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMLV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See
            www.nematode.net for additional project information.

                     optic nerve, retina, Retina Foveal and Macular, RPE and
                     Choroid"
                     /dev_stage="fetal and adult"
                     /lab_host="DH10B (Life Technologies) (T1 phage resistant)"
                     /clone_lib="UI-E-EJ1"
                     /note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a
                     modified polylinker; Site_1: EcoR I; Site_2: Not I;
                     UI-E-EJ1 is a subtracted cDNA library constructed
                     according to Bonaldo, Lennon and Soares, Genome Research,
                     6:791-806, 1996. First strand cDNA synthesis was primed
                     with an oligo-dT primer containing a Not I site. Double
                     stranded cDNA was ligated to an EcoR I adaptor, digested
                     with Not I, and cloned directionally into pT7T3-Pac
                     vector. The oligonucleotide used to prime the synthesis of
                     first-strand cDNA contains a library tag sequence that is
                     located between the Not I site and the (dT)18 tail. The
                     sequence tags for this library are: fetal eyes,
                     AGAATCAAGA; lens, CGATTAGCGA; eye anterior segment,
                     AATGCCGCAT; optic nerve, CCATTAAGTG; retina, CCGCG; Retina
                     Foveal and Macular, GTCC; RPE and Choroid, ACCTA. This
                     library was created for the program, Gene Discovery in the
                     Visual System, supported by National Eye Institute (NEI)."

                     /note="The library Gm-r1088 is a sequence-driven, reracked
                     set of 9,216 low redundancy clones selected from cDNA
                     libraries from various tissues and stages of development
                     of soybean that consists of 2,706 cDNAs from germinating
                     cotyledons (source library Gm-c1027); 1,355 cDNAS from
                     immature seed coats (libraries Gm-c1019 and Gm-c1023); 917
                     cDNAs from tissue culture derived somatic embryos (source
                     libraries Gm-c1036 and Gm-c1075); 3,275 cDNAs from
                     germinating seedlings, shoot tips, or leaves exposed to
                     various stresses (source libraries Gm-c1064, Gm-c1065,
                     Gm-c1066, and Gm-c1067; and Gm-c1068); and 963 cDNAs from
                     young leaves exposed to bacterial and fungal pathogens
                     (source libraries Gm-c1072, Gm-c1073, and Gm-c1074). The
                     5' ESTs of the source clones from the different libraries
                     was used to select singletons, or a representative of each
                     contig, which were reracked to form library Gm-r1088 and
                     the cDNA clones of the reracked Gm-r1088 library were then
                     sequenced at the 3' end. The unigene selection and 3'
                     sequencing was funded by NSF Plant Genome project #9872565
                     (http://soybeangenomics.cropsci.uiuc.edu/) as part of
                     creation of a low redundancy soybean cDNA set. The source
                     cDNA libraries were constructed by the laboratories of
                     Lila Vodkin, University of Illinois, Randy Shoemaker, Iowa
                     State University, and Paul Keim, Northern Arizona
                     University as part of the Public EST project,
                     http://129.186.26.94/soybeanest.html. The contig analysis
                     to select unique genes was performed by the laboratory of
                     Ernest Retzel, Center for Computational Genomics and
                     Bioinformatics, University of Minnesota,
                     http://web.ahc.umn.edu/biodata/nsfsoy/. Reracking and 3'
                     sequencing were conducted by services of the University of
                     Illinois Keck Center for Comparative and Functional
                     Genomics http://www.biotech.uiuc.edu/keck.htm. Note: The
                     corresponding 5' EST from each clone in the Gm-r1088
                     library is listed in the 'OTHER EST' field. The detailed
                     information on the source library for each clone can also
                     be obtained by referring to the Genome Systems clone ID of
                     the original cDNA library that is also listed under 'OTHER
                     EST'."

Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified using Dynabeads (Dynal) and mRNA eluted for first strand synthesis. First strand cDNA was created using MMLV RT (Powerscript, Clontech) and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added using chimeric DNA-RNA oligo. 12 PCR cycles were done using first strand and primers specific to SMART oligo and 3' end. Double stranded cDNA was digested using XhoI/NotI, fractioned on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as host cells. Library materials provided by Dr. David Bird of North Carolina State University. Library construction by Jeff Rousch. See www.nematode.net for additional project information.

                     greenhouse grown"
                     /lab_host="DH10B"
                     /clone_lib="Gm-c1068"
                     /note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
                     XhoI; The cDNA library was constructed from mRNA isolated
                     from drought stressed leaf tissue of the cultivar Williams
                     82. The month old greenhouse grown plants were deprived of
                     water for 3 days prior to harvesting the stressed leaf
                     tissue. Complementary DNA was synthesized from mRNA using
                     a primer consisting of a poly(dT) sequence with a XhoI
                     restriction site. EcoRI adapters were ligated to the
                     blunt-ended cDNA fragments followed by XhoI digestion. The
                     cDNA fragments were directionally cloned into the
                     EcoRI-XhoI restriction site of the pBluescript vector. The
                     ligated cDNA fragments were transformed into DH10B host
                     cells (GibcoBRL). This library was constructed in the
                     laboratory of Dr. Randy Shoemaker."

/note="Vector: pBluescript II SK (+) XR; Site_1: EcoRI (5' end of cDNA); Site_2: XhoI (3' end of cDNA); Sapling trees two metres in height and grown under greenhouse conditions were exposed to continuous feeding by Malacosoma disstria Hubner (forest tent caterpillar) mid-instar larvae caged on the sapling using mesh bags. Mature leaves from within the caged region were collected 2 hours, 12 hours, 24 hours and 48 hours after the onset of treatment. mRNA was isolated from each tissue source independently and equal quantities of mRNA from each tissue were then pooled. cDNA was prepared from 5 micrograms of mRNA and directionally ligated into the pBluescript II SK (+) XR vector using the pBluescript II XR cDNA Library Construction Kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells (Invitrogen) for propagation."

            sperling@cgm.cnrs-gif.fr
COMMENT     The present survey of the Paramecium tetraurelia macronuclear
            genome consists of end sequences of a library of random 4-12 kb
            fragments obtained by Sau3A partial digestion of macronuclear DNA
            cloned in the BamHI site of pBSIIKS-. See [4].
            Genes are predicted from matches to other sequences. For more
            information about this sequence or the Paramecium Project, see
            http://paramecium.cgm.cnrs-gif.fr.

                     /strain="C57BL/6J"
                     /db_xref="taxon:10090"
                     /clone="UUGC1M0042I11"
                     /sex="Male"
                     /lab_host="E. Coli strain XL10-Gold, T1-resistant, F-"
                     /clone_lib="Mouse 10kb plasmid UUGC1M library"
                     /note="Vector: PWD42nv; Purified genomic DNA from M.
                     musculus C57BL/6J (male) was obtained  from the Jackson
                     Laboratory Mouse DNA Resource
                     (http://www.jax.org/resources/documents/dnares/). The DNA
                     was hydrodynamically sheared by repeated passage through a
                     0.005 inch orifice at constant velocity. The sheared DNA
                     was blunt end-repaired with T4 DNA polymerase and T4
                     polynucleotide kinase. Adaptor oligonucleotides were
                     ligated to the blunt ends in high  molar excess. The
                     adaptored DNA was purified and size-selected for a 9.5 to
                     10.5 kb range using preparative agarose gel
                     electrophoresis. Vector DNA was prepared from a derivative
                     of pWD42 (gi|4732114|gb|AF129072.1), a copy-number
                     inducible derivative of plasmid R1. The vector was ligated
                     with adaptors complementary to the insert adaptors and
                     purified. The sheared, adaptored mouse DNA was annealed to
                     adaptored vector DNA, and transformed into
                     chemically-competent E. coli XL10-Gold (Stratagene) cells
                     and selected for ampicillin resistance."

                     /note="Vector: pBRcDNASfiAB; The library was constructed
                     from 10 different sources of RNA from a single genotype.
                     Separate cDNAs were generated using primers that
                     incorporated unique 5' and 3' tags to distinguish each
                     source of RNA. cDNAs were then pooled, size-fractionated,
                     directionally cloned into a custom medium-copy vector and
                     transformations made with four size classes to minimize
                     size bias. Details of each source of RNA and library
                     construction can be obtained at http://cgpdb.ucdavis.edu/

                      /lab_host="DH10B"
                      /clone_lib="Gm-c1052"
                      /note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
                      XhoI; The Harosoy NIL was constructed and seed was
                      provided by Dr. J. Specht, University of Nebraska
                      (Shoemaker and Specht, 1995). The cDNA library was
                      constructed from mRNA isolated from whole seedlings of 1
                      week old greenhouse grown plants. Complementary DNA was
                      synthesized from mRNA using a primer consisting of a
                      poly(dT) sequence with a XhoI restriction site and a 3'
                      anchor. EcoRI adapters were ligated to the blunt-ended
                      cDNA fragments followed by XhoI digestion. The cDNA
                      fragments were directionally cloned into the EcoRI-XhoI
                      restriction site of the pBluescript vector. The ligated
                      cDNA fragments were transformed into DH10B host cells
                      (GibcoBRL). The library was constructed in cooperation
                      with Dr. Paul Keim's laboratory at Northern Arizona
                      University."

/note="Vector: pSPORT1 (Invitrogen); Site_1: SalI; Site_2: NotI; Mouse cDNA project by the Laboratory of Genetics, National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total RNAs were obtained from Dr. Janet Rossant and Tilo Kunath (Samuel Lunenfeld Research Institute, Canada). Double-stranded cDNAs were synthesized with an Oligo(dT) primer [Invitrogen: 5'-pGACTAGTTCTAGATCGCGAGCGGCCGCCCTTTTTTTTTTTTTT-3'] from 4 ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pSPORT1 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.6 kb. The library was constructed by Yulan Piao (NIA)."

                     /lab_host="DH10B"
                     /clone_lib="NIA Mouse Neural Stem Cell (Differentiated)
                     cDNA Library (Long)"
                     /note="Vector: pSPORT1 (Invitrogen); Site_1: SalI; Site_2:
                     NotI; Mouse cDNA project by the Laboratory of Genetics,
                     National Institute on Aging (NIA), Intramural Research
                     Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). This is
                     a long-transcript enriched cDNA library (Ref. Genome Res.
                     11: 1553-1558 (2001). [PMID: 11544199]). Total RNAs were
                     obtained from Dr. Angelo L. Vescovi (Institute for Stem
                     Cell Research, Italy). Double-stranded cDNAs were
                     synthesized with an Oligo(dT) primer [Invitrogen:
                     5'-pGACTAGTTCTAGATCGCGAGCGGCCGCCCTTTTTTTTTTTTTTT-3'] from
                     2.0 Microgram of total RNA, treated with T4 DNA
                     polymerase, and purified by ethanol-precipitation. The
                     cDNAs were ligated to Lone-linker LL-Sal4, purified by
                     phenol/chloroform, and separated from free linkers by
                     Centricon 100. Then, the cDNAs were amplified by
                     long-range high fidelity PCR using Ex Taq polymerase
                     (Takara) with a primer Sal4-S. The products were purified
                     by phenol/chloroform and Centricon 100. The cDNAs were
                     digested with SalI and NotI enzymes and cloned into
                     SalI/NotI site of pSPORT1 plasmid vector. The DH10B E.
                     coli host was transformed with the ligation mixture by the
                     standard chemical method. The average insert size is about
                     3.2 kb. The library was constructed by Yulan Piao."

The library was characterised by oligonucleotide fingerprinting (ONF) to reduce sequencing redundancy. According to the ONF procedure, clones that display the same hybridisation matrix with a battery of 200 8mer oligonucleotides are grouped into clusters. One clone per ONF cluster is selected for sequencing. The size of each cluster is an indicator of the frequency of a transcript in the analysed library. The cluster size as well as the coordinates of the other clones assigned to the same ONF cluster as the clone from which the above EST is generated is available at the sea urchin project web site at: http://www.molgen.mpg.de/ag_seaurchin/ . cDNA clones and filters are distributed via the Resource Center/Primary Database of the German Human Genome Project (http://www.rzpd.de)

/note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2: XhoI; The cDNA library was constructed from mRNA isolated from mature seed pods of greenhouse grown plants prior to senescence for the cultivar KP1. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy Shoemaker."

                     /tissue_type="Leaf, drought stressed, 1 month old plants,
                     greenhouse grown"
                     /lab_host="DH10B"
                     /clone_lib="Gm-c1068"
                     /note="Vector: pBluescript II SK+; Site_1: EcoRI; Site_2:
                     XhoI; The cDNA library was constructed from mRNA isolated
                     from drought stressed leaf tissue of the cultivar Williams
                     82. The month old greenhouse grown plants were deprived of
                     water for 3 days prior to harvesting the stressed leaf
                     tissue. Complementary DNA was synthesized from mRNA using
                     a primer consisting of a poly(dT) sequence with a XhoI
                     restriction site. EcoRI adapters were ligated to the
                     blunt-ended cDNA fragments followed by XhoI digestion. The
                     cDNA fragments were directionally cloned into the
                     EcoRI-XhoI restriction site of the pBluescript vector. The
                     ligated cDNA fragments were transformed into DH10B host
                     cells (GibcoBRL). This library was constructed in the
                     laboratory of Dr. Randy Shoemaker."
